"Transplanting two unique beta-glucanase catalytic activities into one multienzyme, which forms glucose.";
BIOTECHNOLOGY 14:71-76(1996).
-!- CATALYTIC ACTIVITY: ENDOHYDROLYSIS OF 1,4-BETA-D-GLUCOSIDIC LIKRAGES IN CELULOSE.
-!- SUBCELLULAR LOCATION: SECRETED.
-!- SIMILARITY: BELONGS TO CELLULASE FAMILY A (FAMILY 5 OF GLYCOSYL HYDROLASES).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                GLYCOSYL

hydrolysis of 1,4-beta-D-glucosidic linkages in beta-D-glucans such as cellulose and lichenin; can hydrolyze such linkages in beta-D-glucans that also contain
                                                                                                                                                                                                Hall, J.; Black, G.W.; Ferreira, L.M.A.; Millward-Sadler, S.J.; Ali, B.R.S.; Hazlewood, G.P.; Gilbert, H.J. Biochem. J. (1995) 309:749-756

The non-catalytic cellulose-binding domain of a novel cellulase from Pseudomonas fluorescens subsp. cellulosa is important for the efficient hydrolysis of Avicel.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           9
